

## Climate Change: Strategies of Adaptation and Mitigation in Rainfed Agriculture in Relation to Water Management in Andhra Pradesh

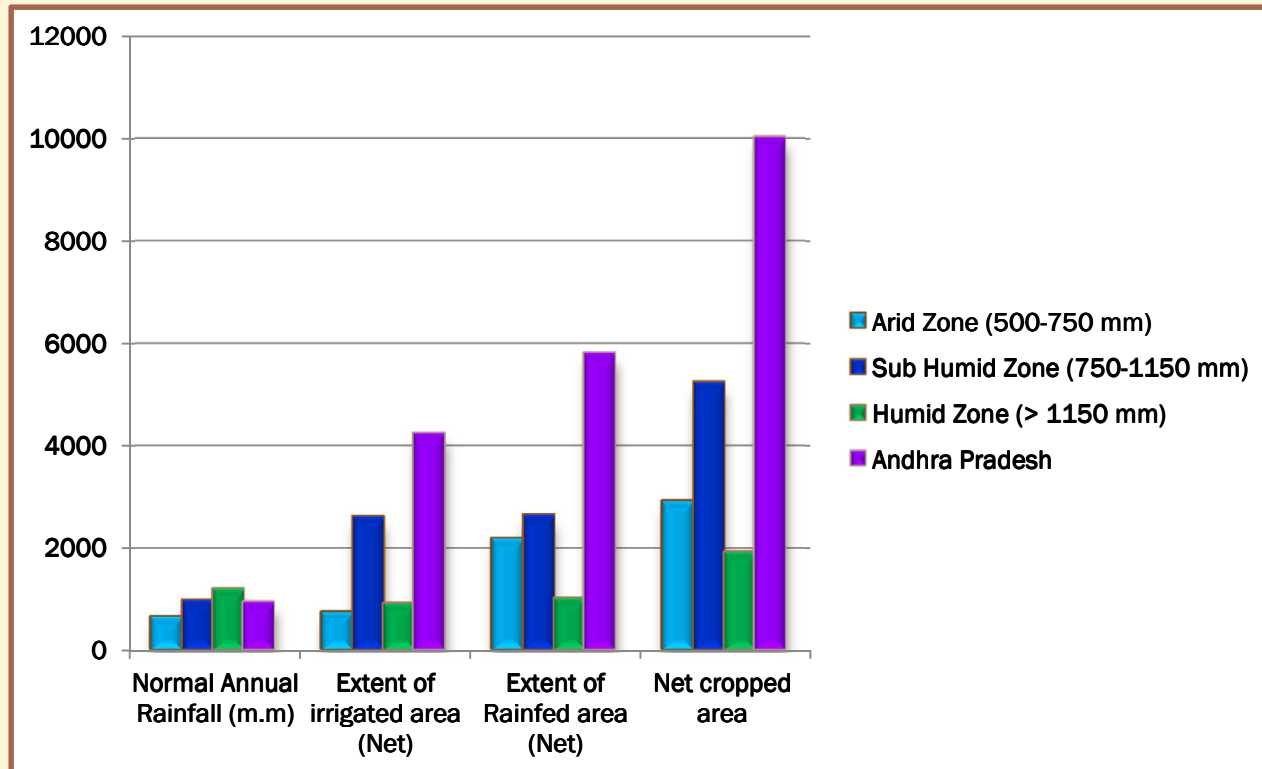

Dr. K. SREENIVAS REDDY, FIE  
Principal Scientist (SWCE),  
CRIDA, Santhoshnagar,  
Hyderabad-500059  
e mail: ksreddy.1963@gmail.com

## PHYSICAL STATISTICS OF ANDHRA PRADESH (2010-11)

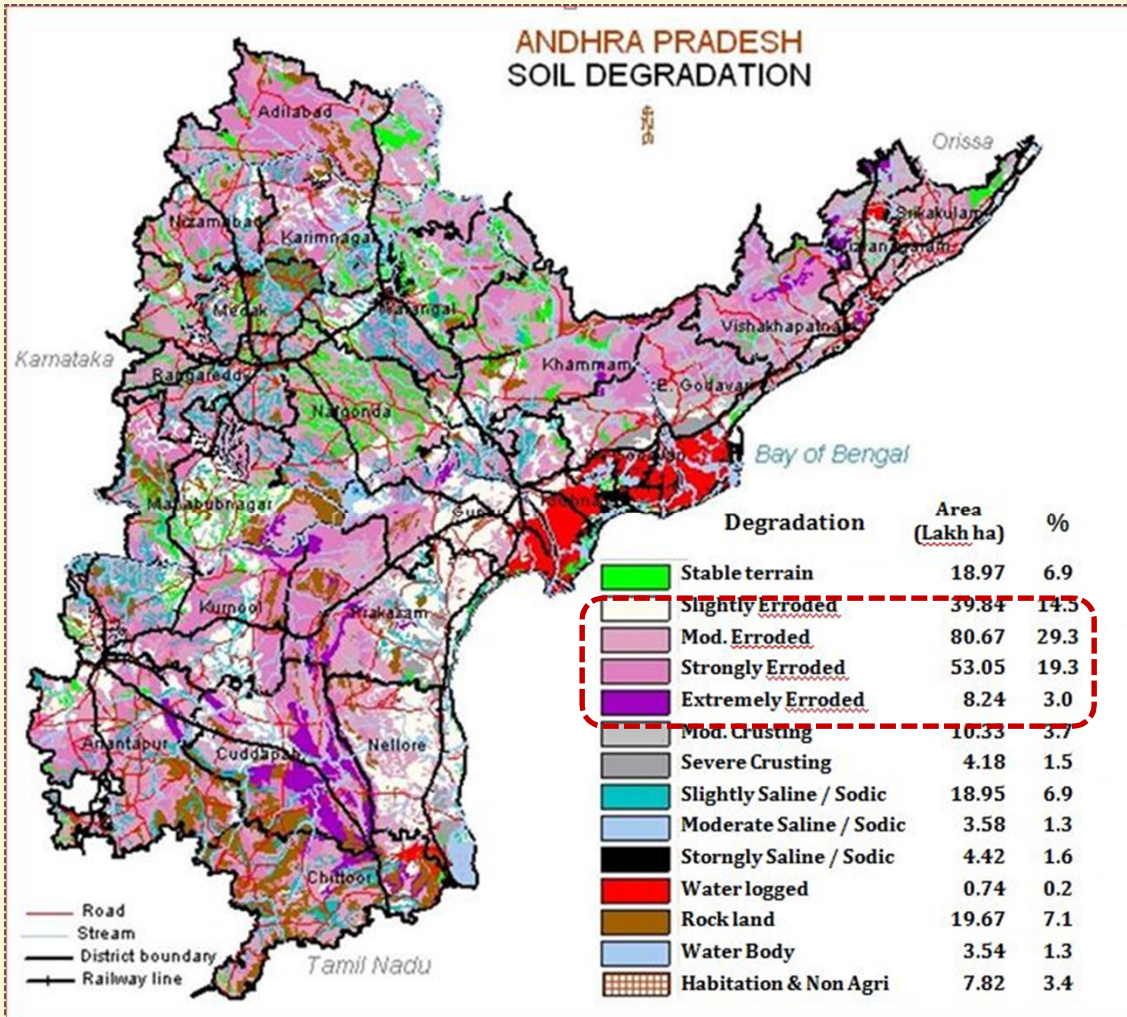

- **The total geographical area : 275.04 Lakh Ha.**
- **Gross Area Sown : 145.12 Lakh Ha**
- **Net area sown:112.88 Lakh Ha**
- **Rainfed Area : 57.77 Lakh Ha**
- **The Area irrigated under canals :14.45 lakh ha**
- **The Area irrigated by Tubewells & Dugwells : 22.83 lakh ha**
- **The Area irrigated by other source :1.53 lakh ha**
- **Number of Pumpsets : 29 lakhs**

## Distribution of Rainfed areas (1000ha) under different Rainfall Zones in Andhra Pradesh

## ANDHRA PRADESH SOIL DEGRADATION

| Degradation    | Area (Lakh ha) | %    |
|----------------|----------------|------|
| Stable         | 18.97          | 6.9  |
| Erroded        | 181.80         | 66.1 |
| Crusted        | 14.51          | 5.2  |
| Saline / Sodic | 26.95          | 9.8  |
| Others         | 23.95          | 8.6  |
| Non Agri       | 7.82           | 3.4  |

## ADAPTATION AND MITIGATION STRATEGIES IN RAINFED AREAS

### Adaptation

- Rainwater Harvesting(In-situ & Ex-Situ)
- Ground Water Recharge
- Drought Resistant crop Varieties
- Enhancing Water Productivity through Efficient Irrigation systems

### Mitigation

- Conservation Agriculture
  - Mulching
  - Low/Minimum Tillage
  - Carbon Sequestration

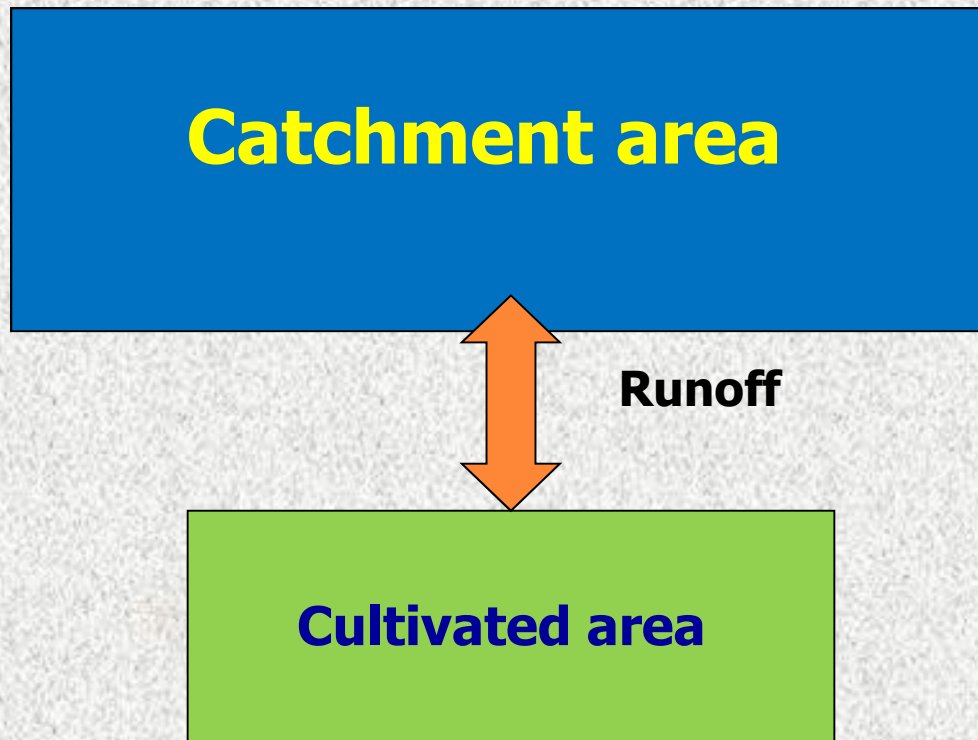

**Estimated potential volume of rainwater storage for  
small-scale water harvesting structures**

| <b>Rainfall zone<br/>(mm)</b> | <b>Geographical<br/>area<br/>(million ha)</b> | <b>Rainwater<br/>availability<br/>(million ha m)</b> | <b>Harvestable<br/>runoff<br/>(million ha m)</b> |

# BASIC MODEL OF WHS

**Present:**

**Community based**

**Future:**

**Individual land holdings**

# **In-situ conservation of rain water:**

**Contour cultivation**

**Tillage Practices- Deep**

**Tied ridging**

**Conservation furrows**

**Broad bed and furrows**

**Vertical mulching**

**Compartmental bunding**

**Conservation furrows + deep tillage in sunflower. Yield benefit 25% over farmers practice**

**Ridges and furrows system in cotton. Additional yield of 500 kg/ha over farmers practice**

***In situ* moisture conservation minimized drought effects across production systems : 270 on farm trials in 18 target districts**

**Pigeonpea in ridge and furrow system recorded 13% yield increase over flat sowing at Mirzapur, UP, India**

**POTENTIAL OF RAIN WATER HARVESTING AND  
RECYCLING AS ON ADAPTATION STRATEGY TO CLIMATE  
VARIABILITY/CHANGE IN RAINFED CROPS**

## Rainfall- Runoff events during Kharif,2009

| Date       | Rainfall, mm | Runoff, mm | Per cent runoff to rainfall |
|------------|--------------|------------|-----------------------------|
| 8/06/2009  | 34.4         | 0.67       | 1.95                        |
| 13/06/2009 | 14.4         | 0.17       | 1.18                        |
| 20/06/2009 | 9.0          | 0.16       | 1.78                        |
| 23/08/2009 | 17.4         | 0.88       | 5.06                        |
| 26/08/2009 | 48.4         | 1.90       | 3.93                        |
| 31/08/2009 | 96.4         | 10.16      | 10.54                       |
| 29/09/2009 | 30.0         | 0.65       | 2.17                        |
| 30/09/2009 | 55.0         | 4.32       | 7.85                        |
| 01/10/2009 | 29.0         | 0.73       | 2.52                        |

- A net work of 6 farm ponds having catchment area from 2 to 14.5 ha at GRF
- Capacity of farm pond ranges from 250 to 1750 m<sup>3</sup>
- Lined with HDPE(500 microns) and Silpaulin (300 gsm) plastic sheet
- Spray gun with 3 hp diesel monoblock pumpset (Discharge:270 lpm at 200 kPa)

### Salient Observations:

- ❖ Seasonal rainfall of 350 mm was recorded(50 % deficit to normal)during 2011 with two rainfall events producing runoff of 1500 m<sup>3</sup> in 6 farm ponds
- ❖ Experiments conducted in groundnut (1.2 acres)and maize (1 acre) with 3 irrigations in groundnut and two irrigations in maize increased the water productivity by 67% over the rainfed in sandy loam and sandy clay loam soils

| Crops                | Rainfall during growing period, mm | Water applied as supplemental irrigation, mm | Total water used, mm | Crop productivity, kg/ha |      |
|----------------------|------------------------------------|--|----------------------|--------------------------|------|

| 2      | 5         | 52.81                |
| 3      | 7.5       | 9.55                 |
| 4      | 10        | 9.61                 |
| 5      | >10       | 8.18                 |

In Andhra Pradesh majority of pumpsets are 5Hp rated. However, on an average 5Hp rating was taken for calculation of Co2 emission.

## SYSTEMS AND PUMPSET EFFICIENCIES FOR DIFFERENT IRRIGATION PRACTICES

| Sl. No. | Irrigation System    | Efficiency (%) |          |         |
|---------|----------------------|----------------|----------|---------|
|         |                      | Application    | Pump set | Overall |
| 1       | Surface Irrigation   | 60             | 50       | 30      |
| 2       | Raingun Irrigation   | 70             | 50       | 35      |
| 3       | Sprinkler Irrigation | 75             | 50       | 37.50   |
| 4       | Drip Irrigation      | 90             | 50       | 45      |

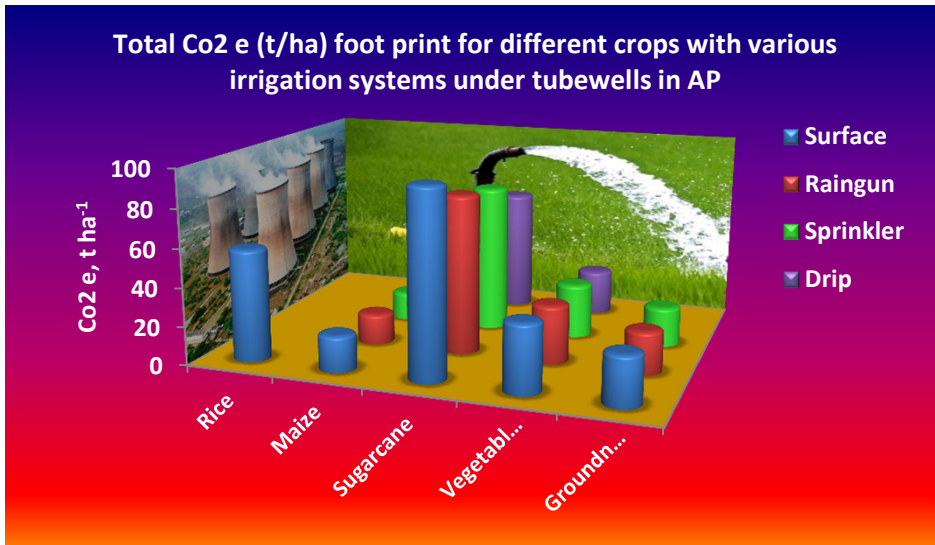

## C-CONTENT AND CO<sub>2</sub> EMISSION RATE FROM DIFFERENT COALS

| Sl. No. | Coal                  | Co2 Emission (Kg/kg of coal) | C-Content (%) |
|---------|-----------------------|------------------------------|---------------|
| 1       | Anthracite            | 3.49                         | 98            |
| 2       | Bituminous            | 2.89                         | 65-92         |
| 3       | <b>Sub-Bituminous</b> | <b>2.38</b>                  | <b>45-65</b>  |
| 4       | Lignite               | 1.46                         | 25-45         |

In this study **sub-bituminous** coal is selected which contains the Co2 emission rate **2.38 kg/kg of coal** burning with **45-65 %** of C-Content and it is most widely used in India and in Andhra Pradesh for producing the electricity in thermal power plants. The coal required to produce 1 kW-hr energy or electricity is 0.5 kg.

Note: R2 is the increase in pumpset efficiency by 5% after replacing the GI pipes with PVC pipes, fittings and low friction foot valve.

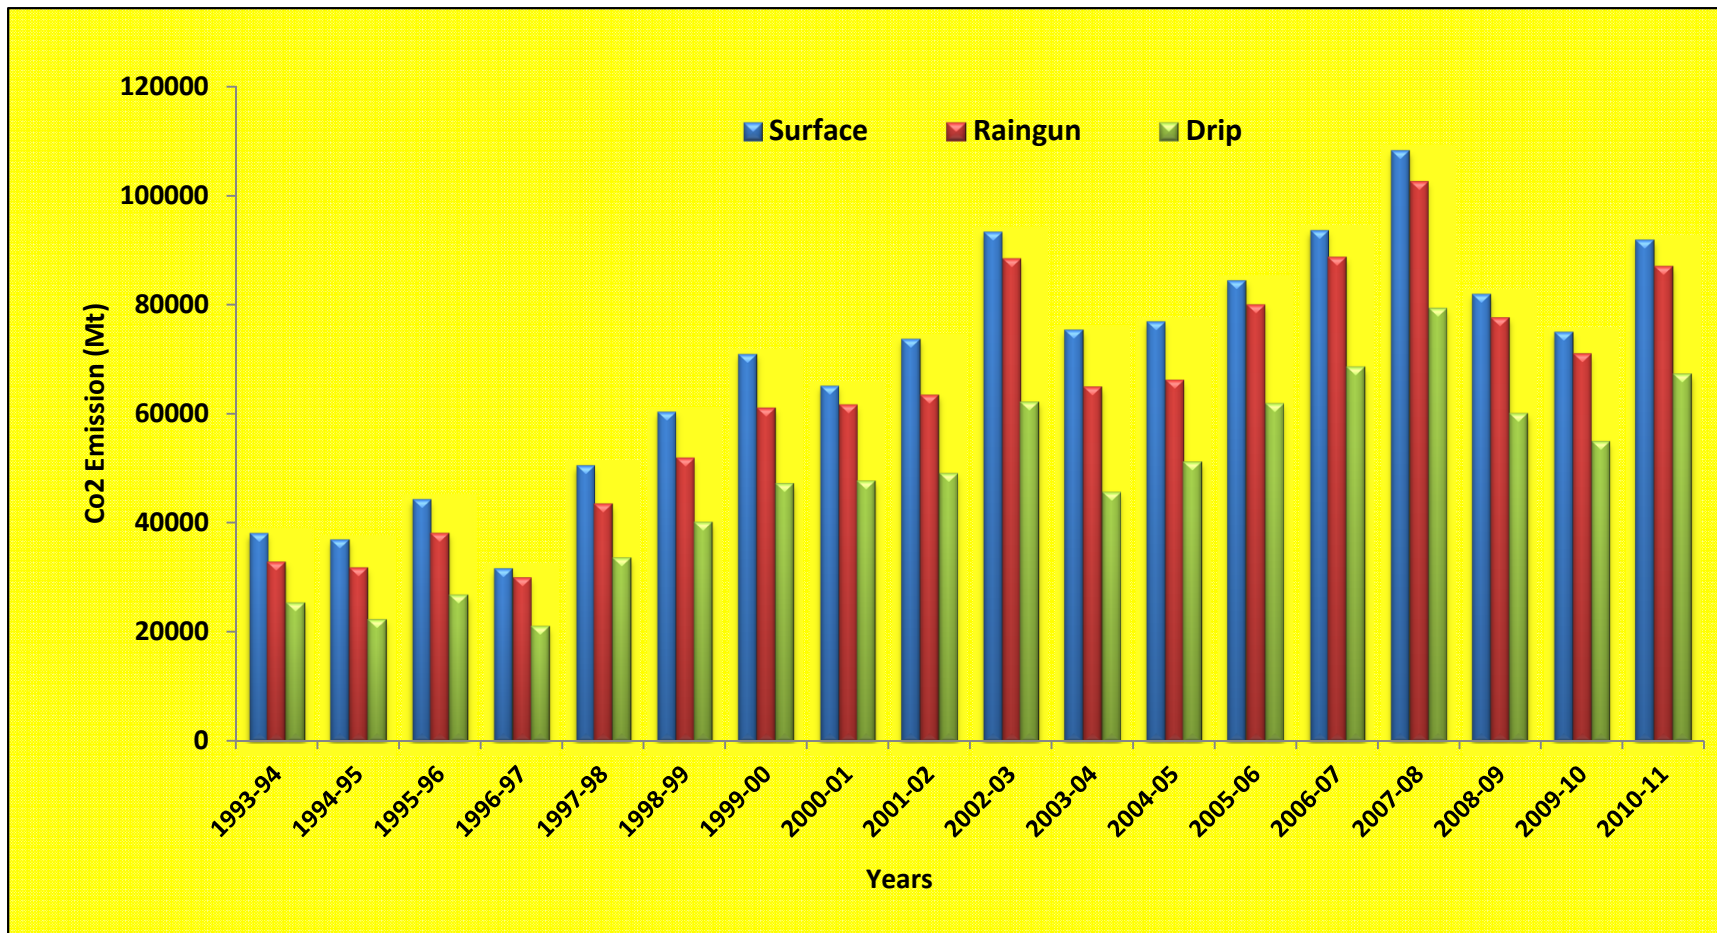

# Development of Co2 foot print for well irrigation in Andhra Pradesh for 5 major crops

## CO<sub>2</sub> EMISSION FOR SUGARCANE UNDER DIFFERENT IRRIGATION SYSTEMS IN AP

### Findings:

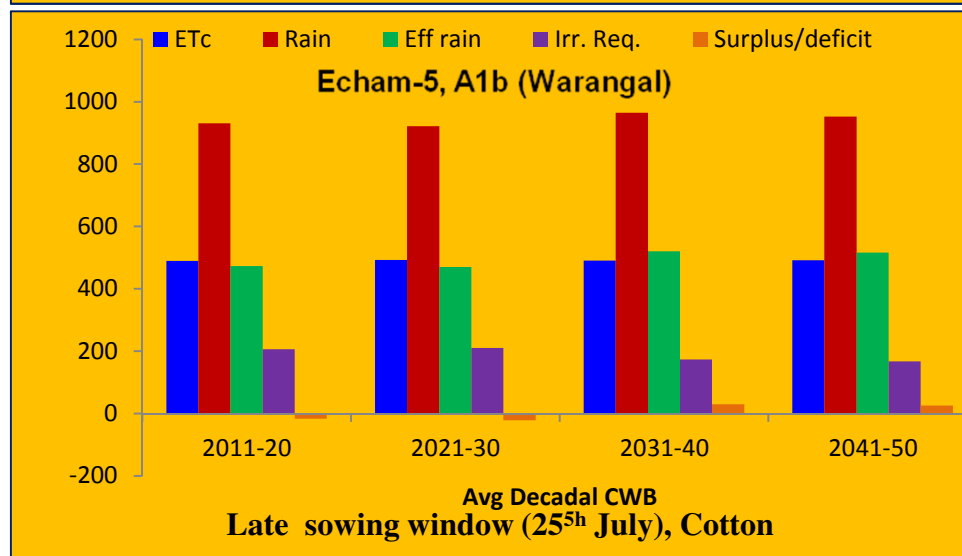

- Out of the components considered, the contribution to Co<sub>2</sub> emission by pump industry is maximum.
- Drip irrigation has the advantage in maximum reduction of global warming potential as mitigation strategy as compared surface irrigation systems under wells.

# Impact of climate change on crop water balance in Telangana region (Maize and Cotton)

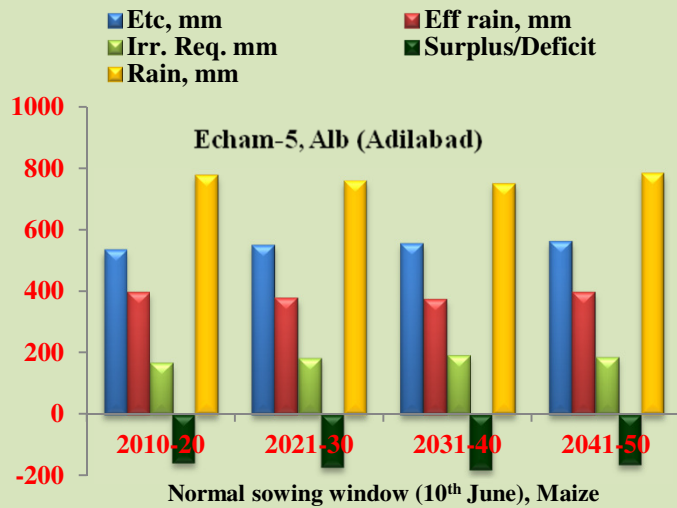

**CROPWAT model was used for calculating crop water balance components of rainfed maize and cotton in 9 districts of Telangana region for different CC scenarios of A1b and A2 of ECHAM5 and CSIRO.**

## Findings:

1. The CC scenarios predicted the shift in the rainfall pattern, reduction in crop ET, increased effective rainfall because of fall in the temperatures.
2. Accordingly, the deficits have been reduced in late sowing as compared to normal sowing of cotton and maize crops.

# Decadal Crop Water Balance for Maize and Cotton in High Rainfall District

## Drought resistant Crop varieties in Andhra Pradesh

| Crop       | Varieties/ Hybrids                       |
|------------|--|
| Oil seeds  |  |
| Ground nut | Abhaya, Navayani , ICGV-9114,            |
| Castor     | PCH-111 , Kranti, Jyothi, Haritha, Kiran |
| Sunflower  | Private Hybrid                           |
| Pulses     |  |
| Redgram    | PRG-158, LRG-50,                         |
| Greengram  | LGG-460                                  |
| Blackgram  | LBG-623, T-9                             |
| Horsegram  | CRIDA-18R, CRHG-4                        |
| Chickpea   | KAK-2                                    |
| Soyabean   | MACH-58, PK-472                          |
| Sorghum    | CSV-23, CSH-16,25                        |
| Bajra      | ICMV-122                                 |
| FT Millet  | Sri lakshmi, Narasimharaya               |
| Cotton     | BT                                       |

### **Sailent findings/Recommendations:**

- Rain water harvesting systems through farm ponds has good potential of adaptation to climate risk in both kharif and rabi rainfed crops. This system has advantage of conservation of both soil, water and nutrients and promotes local water availability for agricultural operations. It can be made for multiple enterprise integrating agriculture, horticulture, fish, poultry etc.
- Aqua crop has been found effective with reliable results for assessing the rain water productivity in rainfed areas.
- The AquaCrop model was calibrated for maize under different supplemental irrigation and crop management practices. The maximum basal crop coefficient for maize varies from 0.75 to 1.05 and water productivity of 31 gm<sup>-2</sup>
- AquaCrop model predicted well with the measured values in case of grain yield, biomass, WP, crop canopy and soil water content. The model efficiency varied from 0.98 to 0.99 for grain yield, biomass and water productivity.
- Under well irrigation, CO<sub>2</sub> foot print was found minimum with drip irrigation system as compared to other surface, raingun and sprinkler.
- The crop water balance for both maize and cotton with Ecam-5 & CSIRO models climate data indicated the reduction in the deficits because of shift in rainfall, reduced Crop ET in case of late sowing of the crops for Telanagana region.
- While introducing the new technologies as a strategy to mitigate the climate change, both investments and incentives for the farmer must be considered for protecting the future agri environment
